Conceptual Review

Consider a Poisson Process with rate λ per unit time. Identify what each random variable represents, and find the distributions of:

- a. N_t ;
- b. W_k ;
- c. T_k . (How is this different from (b)?)

Problem 1

Suppose calls are arriving at a telephone exchange at an average rate of one per second, according to a Poisson arrival process. Find:

- a. the probability that the fourth call after time $t = 0$ arrives within 2 seconds of the third call;
- b. the probability that the fourth call arrives by time $t = 5$ seconds;
- c. the expected time at which the fourth call arrives.

Problem 2: Gammas, Exponentials, and Moments

Consider the gamma function $\Gamma(r) = \int_0^\infty x^{r-1} e^{-x} dx$, $r > 0$.

- Use integration by parts to show that $\Gamma(r+1) = r\Gamma(r)$.
- Deduce from (a) that for any positive integer n , $\Gamma(n) = (n-1)!$
- Show that if $T \sim \text{Exp}(1)$, then $\mathbb{E}(T^n) = n!$.
- Show that if $S = T/\lambda$, then $S \sim \text{Exp}(\lambda)$. (Note: from this, we can easily show that $\mathbb{E}(S^n) = n!/\lambda^n$).

Hint: Consider the expression $P(S > s)$, then substitute for S appropriately.
