Conceptual Review

Please discuss these short questions with those around you in section. These problems are intended to highlight concepts from lecture that will be relevant for today's problems.

- Suppose X, Y are standard normal variables with correlation $\rho = 0.3$, and (X, Y) a point in the plane. True or False: (X, Y) have the same joint distribution as (X_θ, Y_θ) , which is the rotation of (X, Y) clockwise by $-\theta$.
- Suppose (X, Y) follows a standard bivariate normal distribution with correlation ρ . What is the conditional distribution of Y given X ?

Problem 1

Here is a summary of Pre-SAT and SAT scores of a large group of students.

PSAT scores:	average: 1200	SD: 100
SAT scores:	average: 1300	SD: 90
correlation: 0.6		

Assume the data are approximately bivariate normal in distribution.

- Of the students who scored 1000 on the PSAT, about what percentage scored above average on the SAT?
- Of the students who scored below average on the PSAT, about what percentage scored above average on the SAT?
- About what percentage of students got at least 50 points more on the SAT than on the PSAT?

Ex 6.5.1 in Pitman's Probability

Problem 2

Let X and Y be independent standard normal variables.

- a. For a constant k , find $P(X > kY)$;
- b. If $U = \sqrt{3}X + Y$, and $V = X - \sqrt{3}Y$, find $P(U > kV)$;
- c. Find $P(U^2 + V^2 < 1)$;
- d. Find the conditional distribution of X given $V = v$.
